

McKelvey School of Engineering

Fall Semester 2021

CSE467M: Embedded Computing Systems

Homework #4

Chapter 4 problems:

1) Q5-2 (25 points)

```
double getAverage() {  
    double avg = 0;  
    int sum = 0;  
    int newValue = getNewValue(); // get new value from a function  
    circ_update(newValue);        // put the new value into circular buffer  
    for(i=0;i<CMAX;i++) {        // get summation from circular buffer  
        sum += circ_get(i);  
    }  
    avg = (double)sum/(double)CMAX; // get average value  
    return avg;  
}
```

2) Q5-4 (20 points)

a.

$x = a + b;$

$y = c + d;$

$z = x + e;$

single assigned form

$x = a + b;$

$y = c + d;$

$z = x + e;$

b.

$r = a + b - c;$

$s = 2 * r;$

$t = b - d;$

$r = d + e;$

single assigned form

$r1 = a + b - c;$

$s = 2 * r1;$

$t = b - d;$

$r2 = d + e;$

c.

$a = q - r;$

$b = a + t;$

$a = r + s;$

$c = t - u;$

single assigned form

$a1 = q - r;$

$b = a1 + t;$

$a2 = r + s;$

$c = t - u;$

d.

$$w = a - b + c;$$

$$x = w - d;$$

$$y = x - 2;$$

$$w = a + b - c;$$

$$z = y + d;$$

$$y = b * c;$$

single assigned form

$$w1 = a - b + c;$$

$$x = w1 - d;$$

$$y1 = x - 2;$$

$$w2 = a + b - c;$$

$$z = y1 + d;$$

$$y2 = b * c;$$

Please see the next page for the graph.

3) Q5-5 (25 points)

a.

if (y == 2) {r = a + b; s = c - d;}

else r = a - c

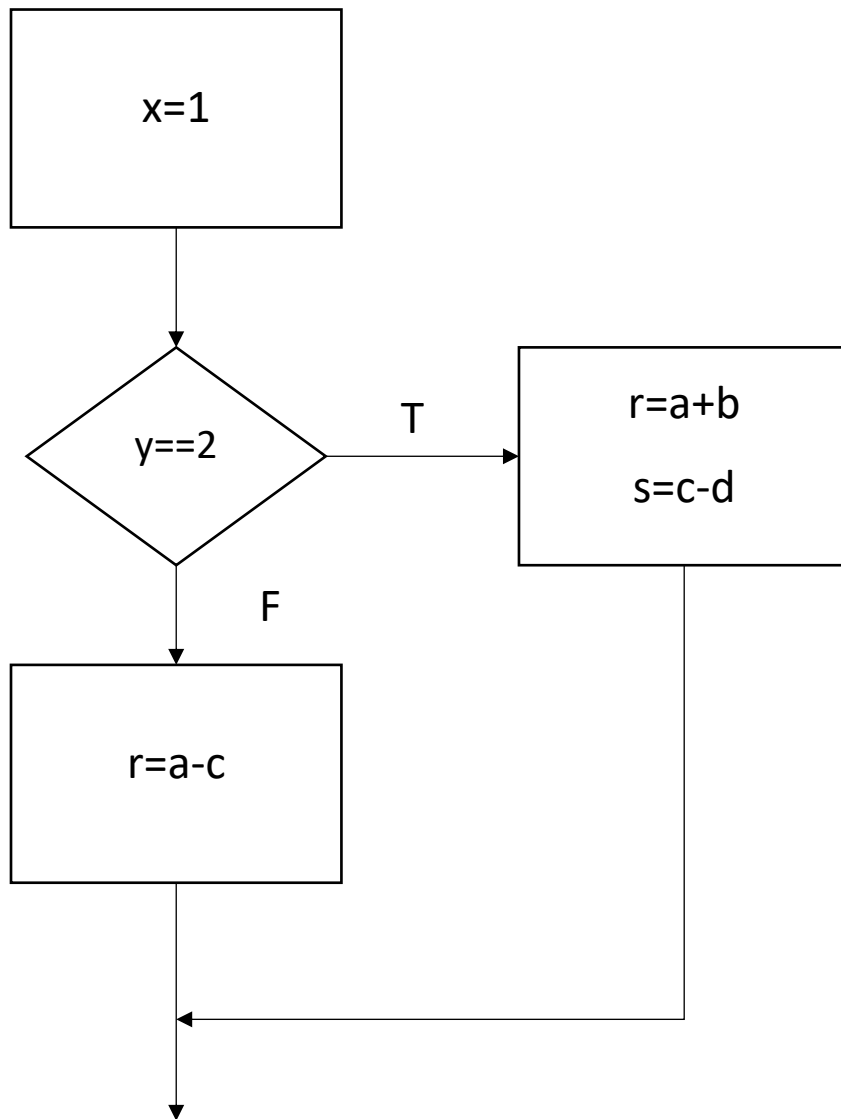

b.

$x = 1;$

if ($y == 2$) { $r = a + b$; $s = c - d$; }

else { $r = a - c$; }

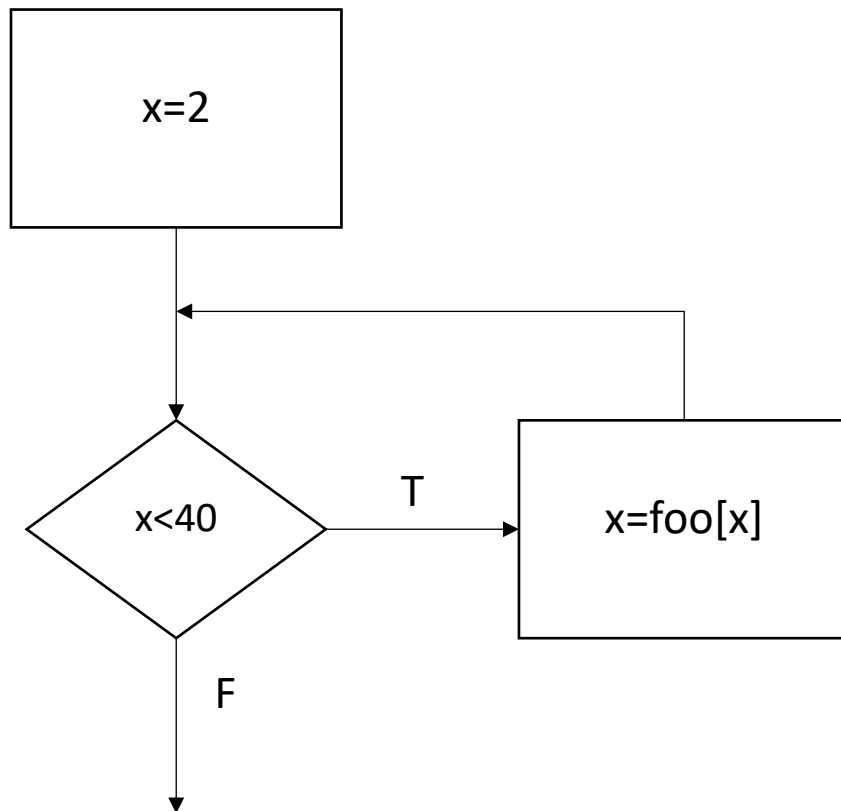

C.

$x = 2;$

while ($x < 40$) {

$x = \text{foo}[x];$

}

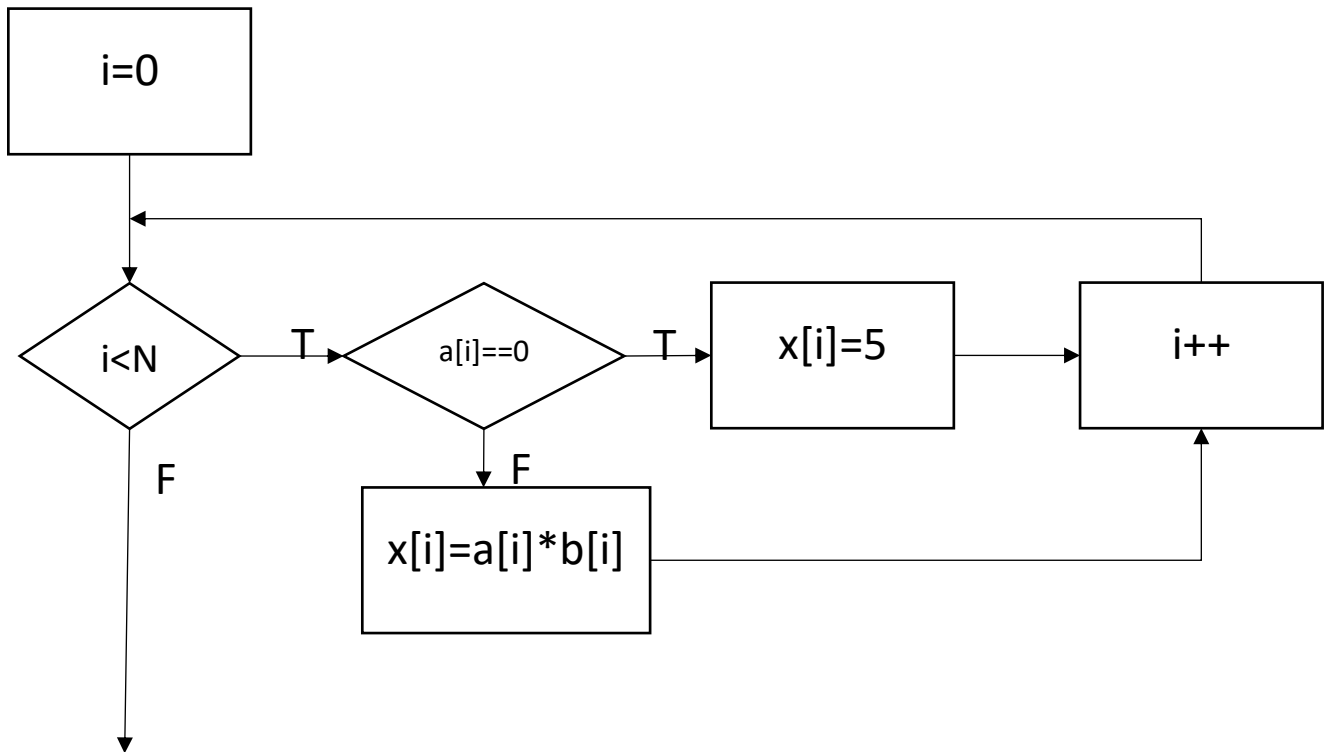

d.

```
for(i=0;i<N;i++) {  
    x[i]=a[i]*b[i]  
}
```

e.

```
for(i=0;i<N;i++) {  
    if(a[i]==0)  
        x[i] = 5;  
    else  
        x[i] = a[i]*b[i];  
}
```

4) Q5-6 (15 points)

a.

ORG 200

p1: ADR r4,a

LDR r0,[r4]

ADR r4,e

LDR r1,[r4]

ADD r0,r0,r1

CMP r0,r1

BNE q1

p2: ADR r4,e

I'll answer to this question in base 16.

Symbol table:

p1 = 0x200

p2 = 0x21C

b.

ORG 100

p1: CMP r0,r1

BEQ x1

p2: CMP r0,r2

BEQ x2

p3: CMP r0,r3

BEQ x3

I'll answer to this question in base 16.

Symbol table:

p1 = 0x100

p2 = 0x108

p3 = 0x110

C.

ORG 200

S1: ADR r2,a

LDR r0,[r2]

S2: ADR r2,b

LDR r2,a

ADD r1,r1,r2

I'll answer to this question in base 16.

Symbol table:

S1 = 0x200

S2 = 0x208

5) Q5-8 (15 points)

a.

```
int p1(int a, int b) {  
    return(a + b);  
}
```

It's reentrant. p1 function does not change global variables.

b.

```
int x, y;  
int p2(int a) {  
    return a + x;  
}
```

It's reentrant. p2 function does not change global variables.

c.

```
int x, y;  
int p3(int a, int b) {  
    if (a > 0)  
        x = b;  
    return a + b;  
}
```

It's NOT reentrant. p3 function changes global variable x.

6) Q5-10 (15 points)

a.

$$\{a+b, c+d\}$$

$$(a+b) - (c+d)$$

$$((a+b) - (c+d)) + e$$

b.

$$\{a+b, d+e\}$$

$$\{(a+b) - c, (d+e) + f\}$$

c.

$$\{a+b, c+d\}$$

$$(a+b) + c$$

$$((a+b) + c) + f$$

$$g = (((a+b) + c) + f) + (c+d)$$

7) Q5-12 (10 points)

for (i = 0; i < 32; i++)

x[i] = a[i] * c[i];

a. Unroll two times :

for(i=0; i<16; i++)

{

x[(2*i)] = a[(2*i)] * c[(2*i)];

x[(2*i)+1] = a[(2*i)+1] * c[(2*i)+1];

}

b. Unroll three times :

for(i=0; i<10; i++)

{

x[(3*i)] = a[(3*i)] * c[(3*i)];

x[(3*i)+1] = a[(3*i)+1] * c[(3*i)+1];

x[(3*i)+2] = a[(3*i)+2] * c[(3*i)+2];

}

x[30] = a[30] * c[30];

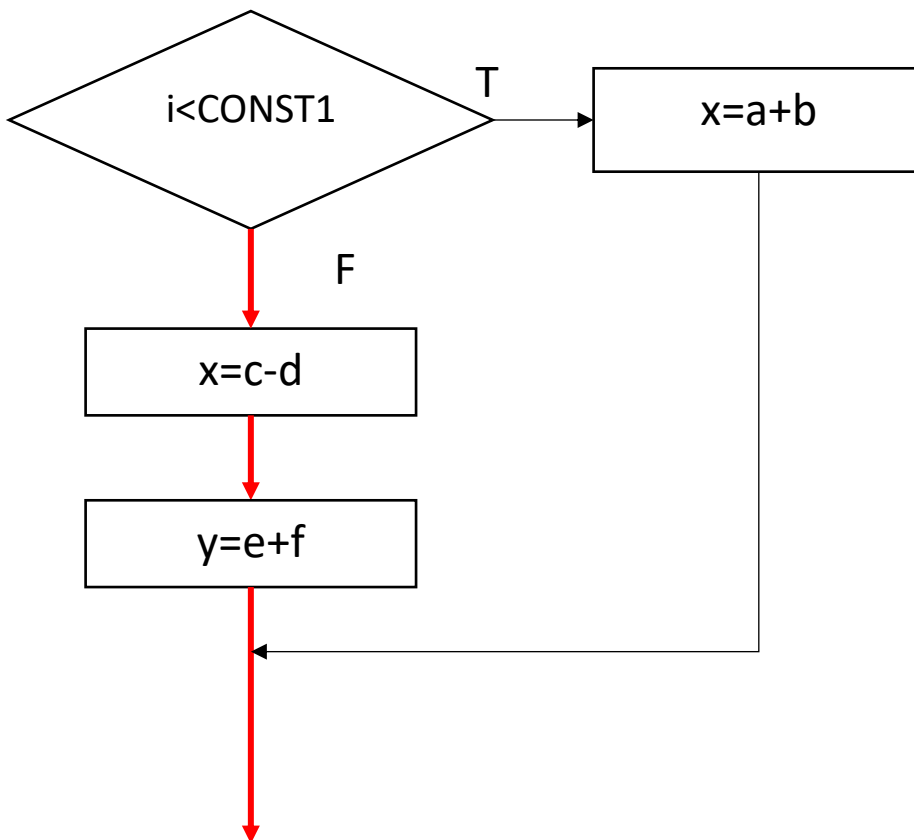

x[31] = a[31] * c[31];

8) Q5-18 (15 points)

a. The longest path is the FALSE case of if statement.

if ($i < \text{CONST1}$) { $x = a + b$; }

else { $x = c - d$; $y = e + f$; }

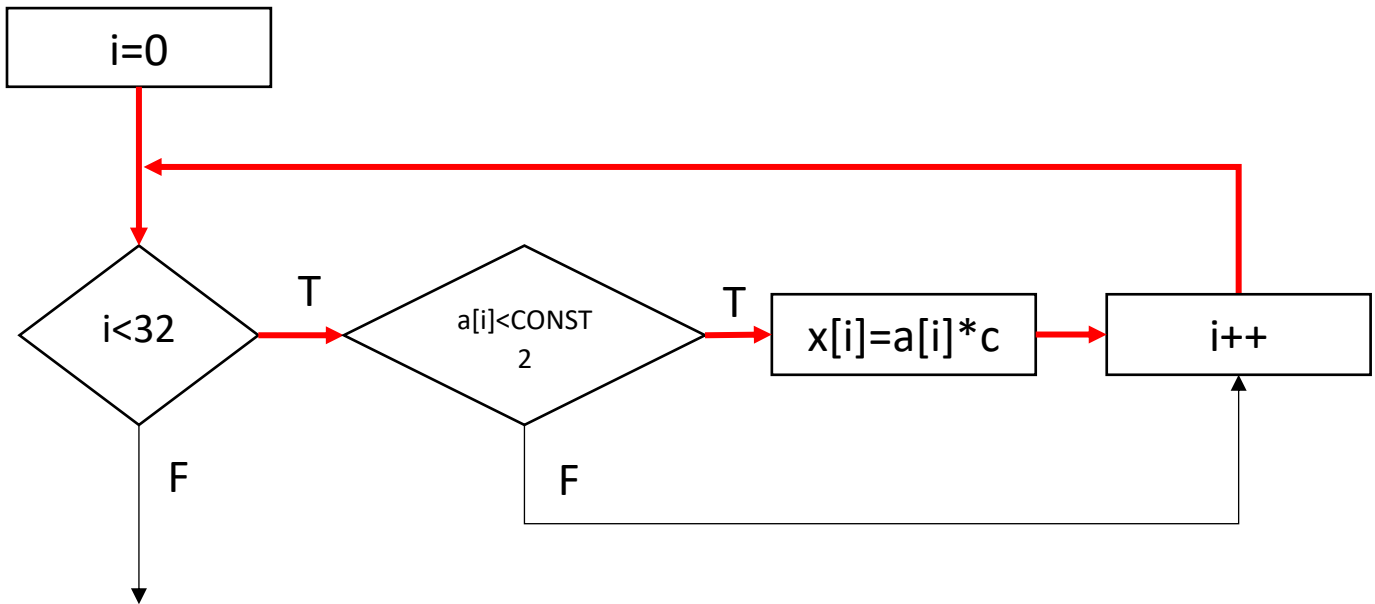

b. The longest path is the TRUE case of if statement inside of for statement.

for (i = 0; i < 32; i++)

if (a[i] < CONST2)

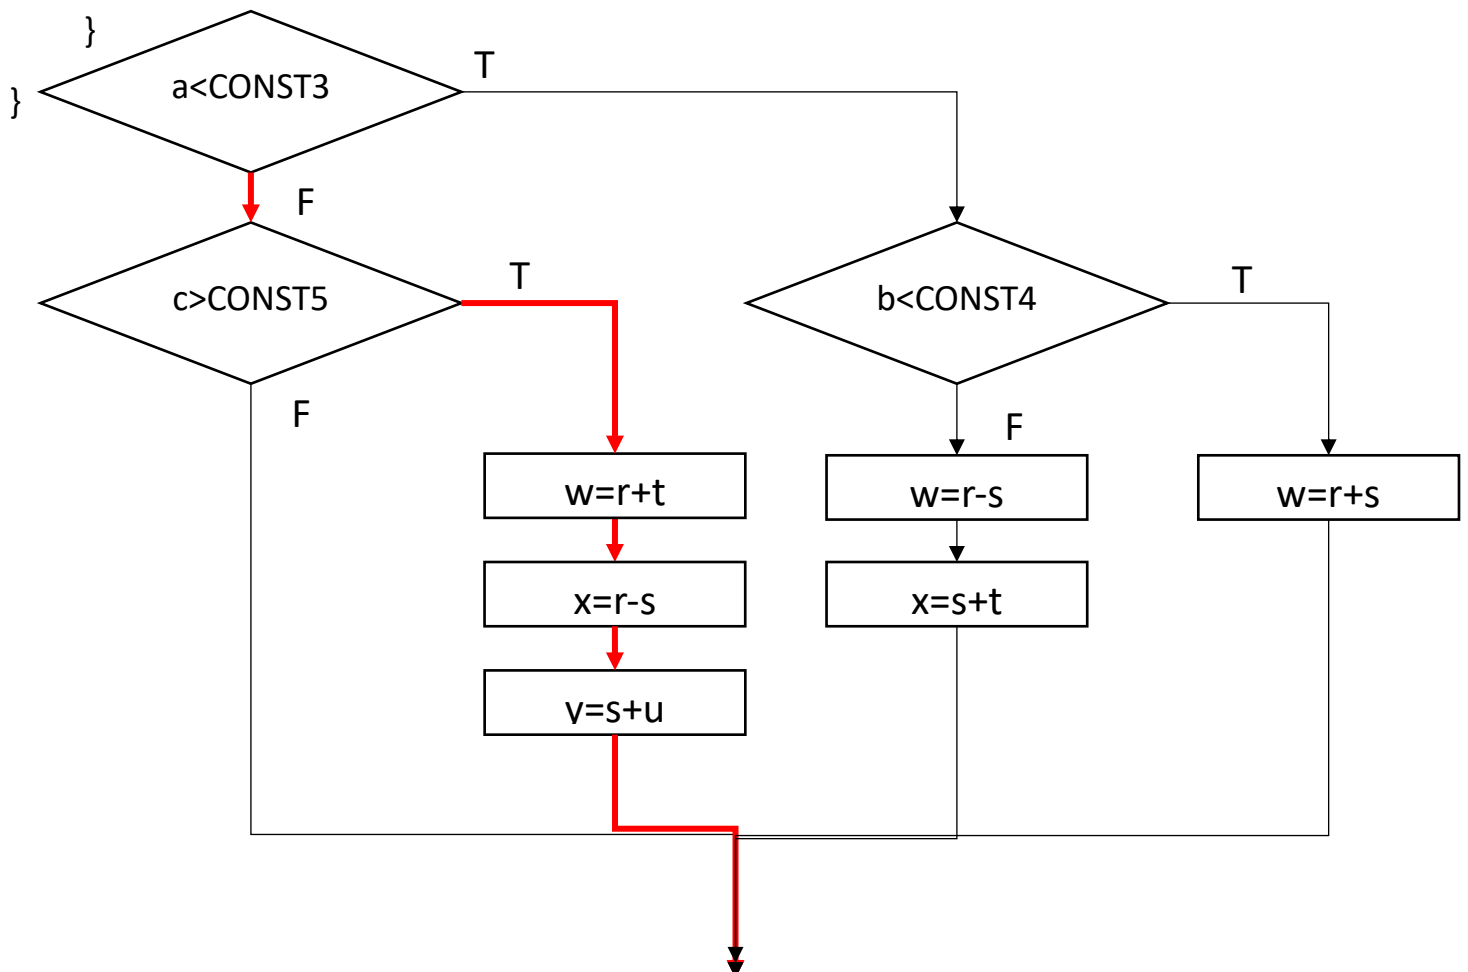

x[i] = a[i] * c[i];

c. The longest path is the first FALSE and the second TRUE statements

```
if (a < CONST3) {  
    if (b < CONST4)  
        w = r + s;  
    else {  
        w = r - s;  
        x = s + t;  
    }  
} else {
```

```
    if (c > CONST5) {  
        w = r + t;  
        x = r - s;  
        y = s + u;  
    }  
}
```

9) Q5-21 (40 points)

a. maximum number

B1: 1 Times(initialize)

B2: 17 Times(loop test)

B3: 16 Times($x[i]$ test)

B4: 16 Times(body)

B5: 16 Times($i++$)

b. minimum number

B1: 1 Times(initialize)

B2: 17 Times(loop test)

B3: 16 Times($x[i]$ test)

B4: 0 Times(body), when $x[i] > 2$ is false

B5: 16 Times($i++$)

c. maximum execution time

$$B1 : 1 * 6 = 6$$

$$B2 : 16 * 2 + 1 * 5 = 37$$

$$B3 : 16 * 3 = 48,$$

$$B4 : 16 * 7 = 112$$

$$B5 : 16 * 1 = 16$$

$$\text{Total} = 6 + 37 + 48 + 112 + 16 = 219 \text{ cycles}$$

d. minimum execution time

$$B1 : 1 * 6 = 6$$

$$B2 : 16 * 2 + 1 * 5 = 37$$

$$B3 : 16 * 3 = 48,$$

$$B4 : 0$$

$$B5 : 16 * 1 = 16$$

$$\text{Total} = 6 + 37 + 48 + 0 + 16 = 107 \text{ cycles}$$

10) Q5-24 (60 points)

Since the size of cache is 1K words= 1024 words with 4 words per line , hence number of cache lines = $1024/4 = 256$ cache lines.

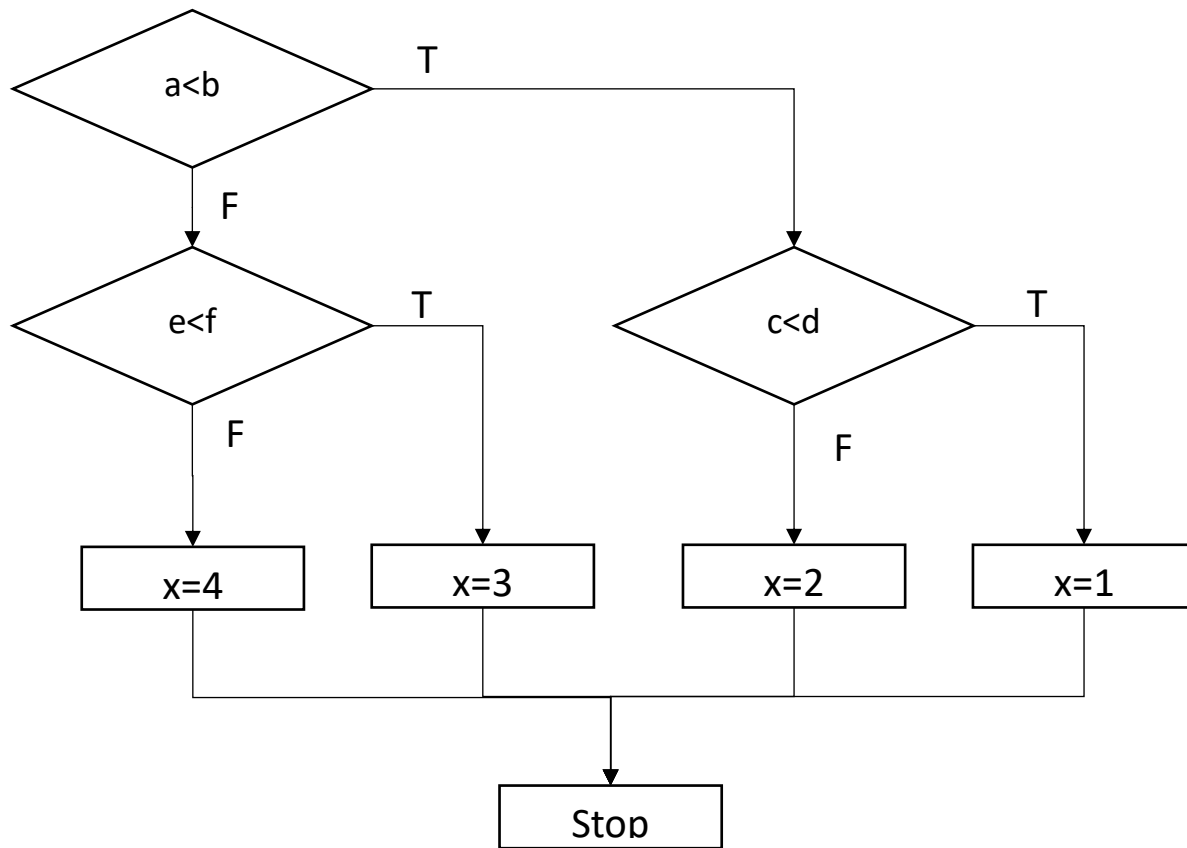

a. To produce a conflict miss every time, the cache has to be replaced whenever 'x' array and 'a' array are referenced. To do that address gap between the a and x should be a multiple of 1024. As a result, $a[i][j]$ and $x[i][j]$ are mapped to the same location in the cache for every referece.

b. To produce a conflict miss one out of every four times, we need more address gap to hold the inner loop memory space. If the gap is $1024*k+3$, the conflict miss will happen one out of every four times. Because j is referring from 0 to 3 so there must be memory space for 4 words to hold the one inner loop.

c. The size of whole loop array is $50 * 4 = 200$ words. So, if the gap between the 'x' array and 'a' array is more than 200 words and then there will not be a conflict miss. Since we have 1024 cache memory, the upper bound should be lower than 1024. As a result the address gap between two array is $1024 * k + x$, where $200 < x < 1024$.

11) Q5-26 (60 points)

a.

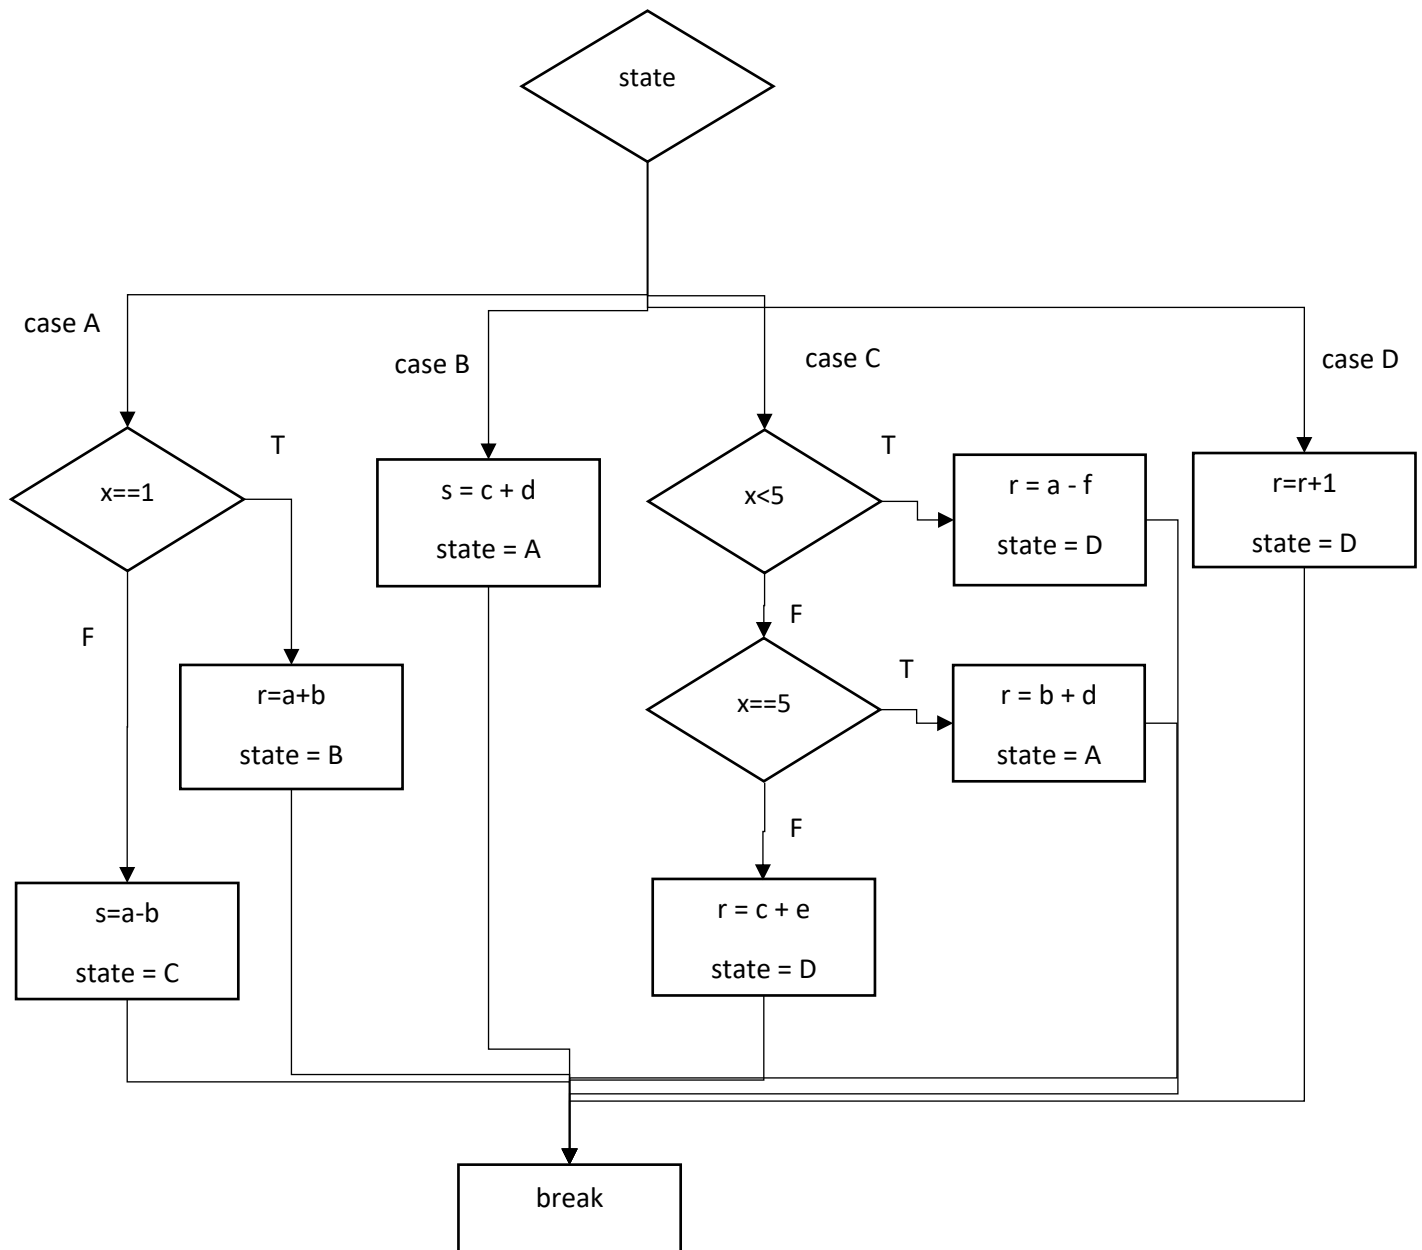

a. The cyclomatic complexity = $e - n + 2p$

e: number of edges, n: number of nodes, p: number of component

$e = 10, n = 8, p = 1$

$10 - 8 + 2 = 4$

b.

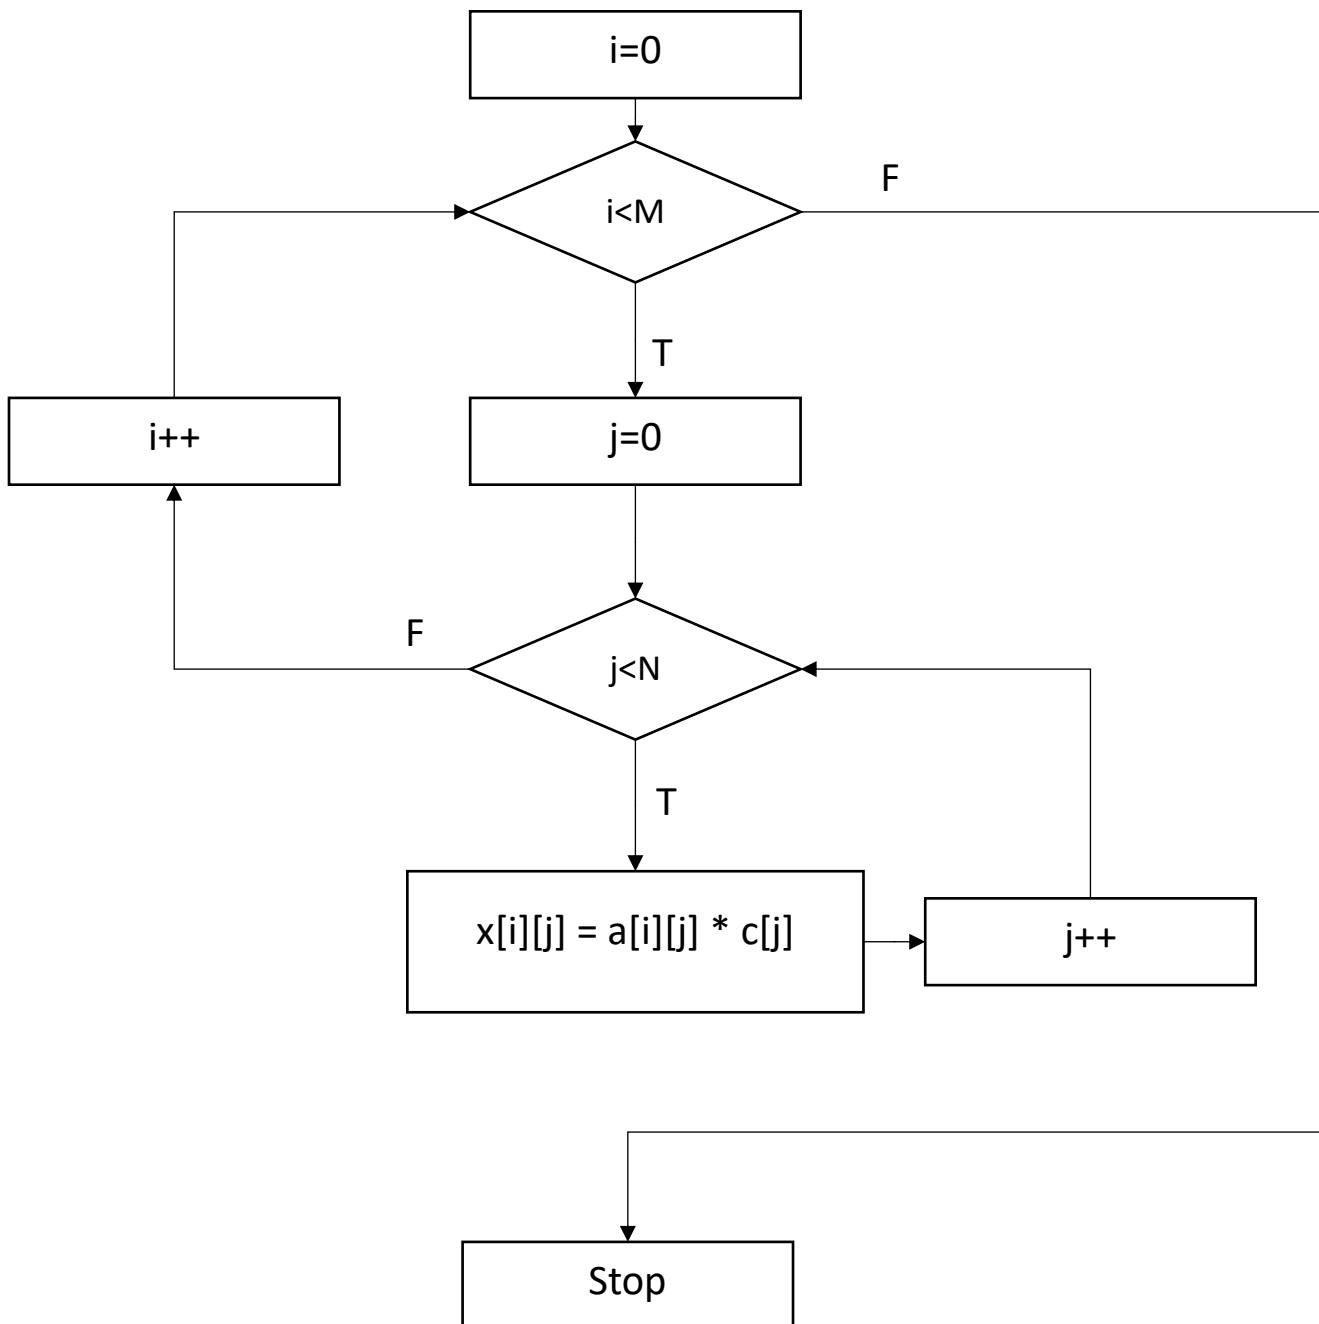

b. The cyclomatic complexity = $e - n + 2p$

e: number of edges, n: number of nodes, p: number of component

$e = 17, n = 12, p = 1$

$17 - 12 + 2 = 7$

c.

b. The cyclomatic complexity = $e - n + 2p$

e : number of edges, n : number of nodes, p : number of component

$e = 9, n = 8, p = 1$

$9 - 8 + 2 = 3$

12) Raspberry Pi Circuit Card Assembly (CCA) Laboratory #2– Measuring code execution time (500 points)

For this laboratory you need to do the following tasks:

12.1) Write C program (or Python program) that does the following mathematical functions:

```
for ( i = 0, f = 0, g = 0; i<20; i++) {
    f = f + a[i]*b[i] + c[i]*d[i] - e[i];
    g = g + (a[i]+d[i])*(b[i] - c[i])*e[i];
}
```

```
printf(f);
```

```
printf(g);
```

Arrays a, b, c, d and e are shown here:

| a | b | c | d | e |
|----|----|----|-----|-----|
| 1 | 3 | 2 | 5 | 10 |
| 3 | 7 | 5 | 10 | 25 |
| 5 | 11 | 8 | 15 | 40 |
| 7 | 15 | 11 | 20 | 55 |
| 9 | 19 | 14 | 25 | 70 |
| 11 | 23 | 17 | 30 | 85 |
| 13 | 27 | 20 | 35 | 100 |
| 15 | 31 | 23 | 40 | 115 |
| 17 | 35 | 26 | 45 | 130 |
| 19 | 39 | 29 | 50 | 145 |
| 21 | 43 | 32 | 55 | 160 |
| 23 | 47 | 35 | 60 | 175 |
| 25 | 51 | 38 | 65 | 190 |
| 27 | 55 | 41 | 70 | 205 |
| 29 | 59 | 44 | 75 | 220 |
| 31 | 63 | 47 | 80 | 235 |
| 33 | 67 | 50 | 85 | 250 |
| 35 | 71 | 53 | 90 | 265 |
| 37 | 75 | 56 | 95 | 280 |
| 39 | 79 | 59 | 100 | 295 |

Specify all arrays inside the main program.

Turn in copy of your code in your homework.

My code is shown below.

```
import time

a = [1,3,5,7,9,11,13,15,17,19,21,23,25,27,29,31,33,35,37,39]
b = [3,7,11,15,19,23,27,31,35,39,43,47,51,55,59,63,67,71,75,79]
c = [2,5,8,11,14,17,20,23,26,29,32,35,38,41,44,47,50,53,56,59]
d = [5,10,15,20,25,30,35,40,45,50,55,60,65,70,75,80,85,90,95,100]
e = [10,25,40,55,70,85,100,115,130,145,160,175,190,205,220,235,250,265,280,295]

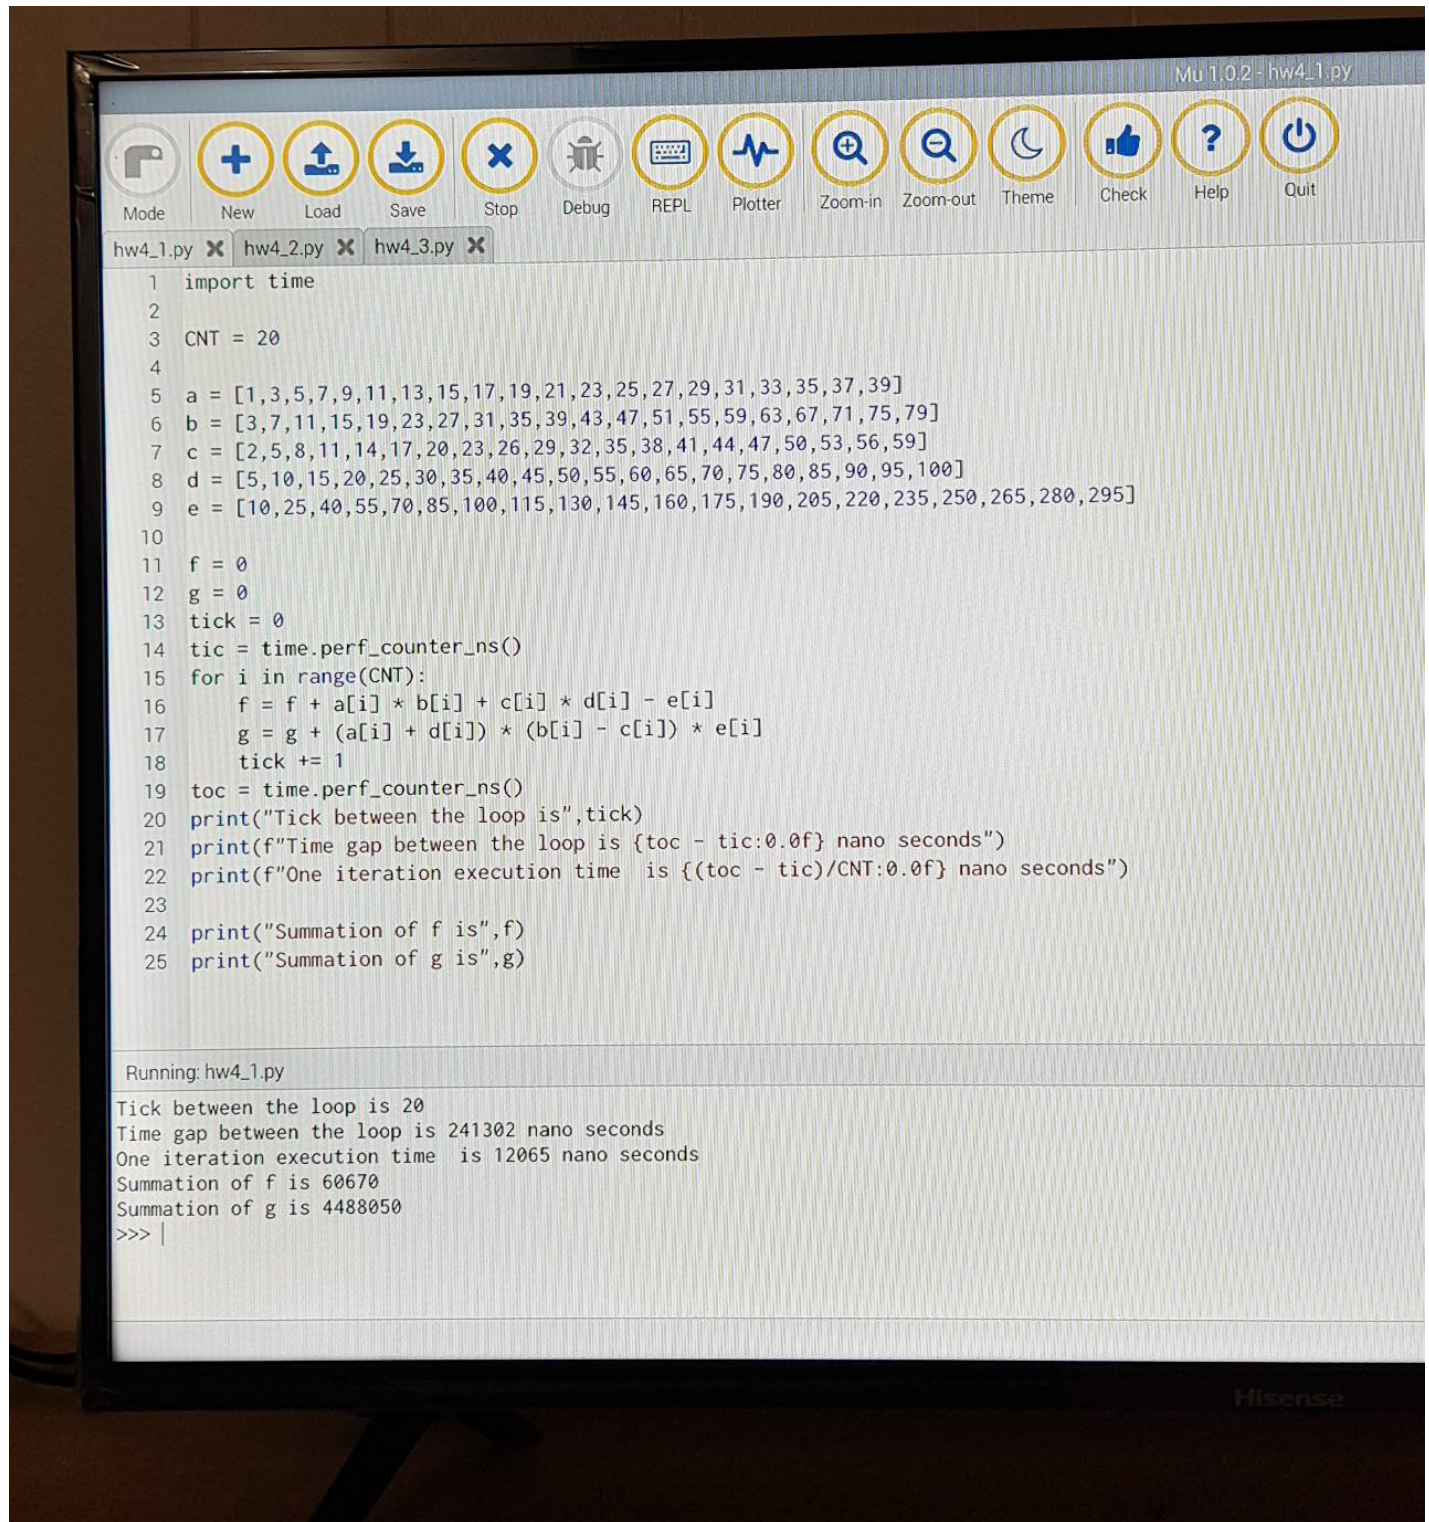

f = 0
g = 0
tick = 0
tic = time.perf_counter_ns()
for i in range(20):
    f = f + a[i] * b[i] + c[i] * d[i] - e[i]
    g = g + (a[i] + d[i]) * (b[i] - c[i]) * e[i]
    tick += 1
toc = time.perf_counter_ns()
print("Tick between the loop is",tick)
print(f"Time gap between the loop is {toc - tic:0.0f} nano seconds")

print("Summation of f is",f)
print("Summation of g is",g)
```

12.2) Compile your C (python) program and run it. Make sure that your results for f and g are displayed. Print copy of your screen and turn it in your homework showing final results for f and g.

Summation of f is 60670

Summation of g is 4488050

```

Tick between the loop is 20
Time gap between the loop is 241302 nano seconds
One iteration execution time is 12065 nano seconds
Summation of f is 60670
Summation of g is 4488050
>>> |
```

12.3) Figure out how to turn in timer on your Raspberry Pi and measure how long it takes to calculate the entire for-loop. Turn in your timing analysis in your homework including code and timing results.

The test case as given above only covers 20 loops, so I made it thousands of times to get the exact execution time. I have tested for 3 cases.

First Case is 20, second is 1000, third is 5000 iterations.

You can see that the first case requires more execution time for one iteration because the overhead of the loop has more impact when the loop only executes 20 times. However, in the third case, you can see that the time is shortened because the overhead of the loop does not significantly affect the total execution time.

As a result, when investigating execution time, we need to test a certain number of times that is not affected by the overhead.

| CNT | Total execution time (nano second) | Simulation time for one iteration(nano second) |
|------|---------------------------------------|---|
| 20 | 241302 | 12065 |
| 1000 | 8482715 | 8483 |
| 5000 | 38480655 | 7696 |

Please see the screenshot below.

The image shows a MuPython IDE window titled "Mu 1.0.2 - hw4_1.py". The interface includes a toolbar with icons for Mode, New, Load, Save, Stop, Debug, REPL, Plotter, Zoom-in, Zoom-out, Theme, Check, Help, and Quit. Below the toolbar, there are three tabs: "hw4_1.py", "hw4_2.py", and "hw4_3.py". The "hw4_1.py" tab is active, displaying a Python script. The script defines five lists (a, b, c, d, e), initializes variables f, g, and tick, and then enters a loop that calculates f and g for each element in the lists. After the loop, it prints the tick value, the time gap between the loop, the execution time per iteration, and the final summations of f and g. The output window at the bottom shows the results of running the script.

```
1 import time
2
3 CNT = 20
4
5 a = [1,3,5,7,9,11,13,15,17,19,21,23,25,27,29,31,33,35,37,39]
